

Summary of Fixes, Features, and Cleanup

Date: July 7, 2026 | Project: RangRiti

1. Project Overview and Rebranding

This update addresses key authentication logic errors, database size limits, and implements a full rebranding from 'Rangriti' to 'RangRiti'. Security policies have been simplified by shifting verification processes completely to high-security mobile SMS verification, omitting complex SMTP verification.

2. App Rebranding to 'RangRiti'

Rebrand Name: RangRiti

All user-visible display elements, headers, splash-screen references, onboarding text, and emails have been updated to match the new name format: 'RangRiti'. Stale or unused references are removed, while internal development structures (like AsyncStorage keys, package names, and app slugs) are kept intact to ensure update compatibility.

3. Firebase Artist Registration and Database Optimization

Issue Resolved: Registration requests not appearing in the admin dashboard or Firestore.

Root Cause: Firestore has a 1MB per-document limit. Large base64 images (portfolio pictures, ID photo, cheque photo) submitted by the artist exceeded this limit, causing silent write failures.

Fix Implemented: Implemented a Firestore document size guard. Large base64 images are stripped out of the document during write and replaced with small flags ([portfolio_image_1], [id_card_uploaded]). The full images remain stored in the memory for immediate use, preventing size limit issues.

Error Propagation: Modified saveArtist to re-throw exceptions on database failures, enabling the registration screen to capture issues and display a 'Retry' dialog with descriptive error messages instead of false successes.

4. Firebase Phone Auth (Real SMS Verification)

Feature: Replaced the dummy OTP simulation toast/SMS banner with real Firebase Phone Authentication.

Security Flow: Authentication now uses expo-firebase-recaptcha and the modular Firebase SDK. When a user logs in, they pass an invisible reCAPTCHA challenge, and Firebase triggers a real SMS OTP.

OTP Structure: Updated the OTP verification input from a 4-digit code to a standard 6-digit verification code to comply with standard Firebase authentication rules.

5. UPI Payment Integration

Form Changes: Replaced outdated banking forms (Bank Account, IFSC, Cancelled Cheque upload) with modern UPI payment details.

Fields Added: Users now input their UPI ID (e.g., username@upi) and upload a screenshot of their UPI QR Code. The

QR image utilizes a responsive 180x180 px preview wrapper, with instant 'Replace QR' and 'Remove' functions.

6. Image Action Sheet Modal

Interaction Flow: Whenever a photo is chosen (Portfolio, ID Document, or UPI QR), an elegant bottom-sheet modal slides up to prompt the user for their desired action.

Options Provided:

1. Save Photo: Saves the current photo in the registration form.
2. Crop / Adjust: Re-opens the photo selector with full cropping edit options active.
3. Select Another Photo: Discards the current image and opens the gallery instantly.
4. Cancel: Closes the sheet and preserves the original selections.

Replace Feature: Portfolio thumbnails now have an edit overlay badge. Tapping any uploaded photo opens the action sheet, allowing users to crop or replace individual images.

7. Verification Process Simplification

By popular demand, the email OTP verification mechanism is completely deactivated. Shifting all verification to Firebase Phone Auth (real SMS verification) makes customer registration much faster. The customer login flow now accepts Name, State, City, Area, and verifies via SMS OTP. Email fields and SMTP configuration requirements have been completely removed from both Login and Sign Up views.

System Note for Deployment

Because this update alters native settings (name property in app.json), a fresh EAS build and submission is required. Subsequent JS/UI logic changes can be pushed instantly using expo-cli's OTA updates.
